

ABSTRACT

A decorating sheet comprises a transparent resin substrate sheet 1 and a glossy layer 2 laminated to the back surface of the transparent resin substrate sheet 1, and the front surface of the transparent resin substrate sheet 1 is divided into high-gloss portions H and low-gloss portions L. The transparent resin substrate sheet 1 is thick at the high-gloss portions and thin at the low-gloss portions, and, owing to these portions, the decorating sheet can provide a pattern that is visually sensed as if it were a three-dimensional pattern. This transparent resin substrate sheet 1 is composed of two layers, a crystalline resin layer 11 and a non-crystalline resin layer 12. A decorated molded product Pd can be obtained by laminating this decorating sheet to a resin molded product 5.
